🎯 Bonus Skill #1: Competitor Monitor (Rakip İzleyici)

Ne işe yarar: Rakip web sitelerini izler, fiyat değişikliklerini, yeni özellik eklemelerini, landing page değişikliklerini tespit eder ve haftalık rapor sunar.

Oluşturma Prompt'u:

Use the Skill Creator skill.

Create a skill named "Competitor Monitor".

Goal: Track competitor websites, detect changes in pricing, features, messaging, and provide competitive intelligence reports.

Components:

1) references/competitors.md — competitor list template:
  - Competitor name
  - Website URL
  - Products/services to track
  - Key pages to monitor (pricing, features, homepage, about)
  - Last check date

2) scripts/scrape_competitor.py — Python script that:
  - Takes a URL and fetches page content
  - Extracts key elements: pricing tables, feature lists, headlines, CTAs
  - Compares with previous snapshot (if available)
  - Detects changes: price changes, new features, messaging updates
  - Returns structured JSON: competitor_name, changes_detected, pricing_delta, new_features, messaging_changes

3) scripts/compare_features.py — Python script that:
  - Takes multiple competitor data
  - Creates comparison matrix (features × competitors)
  - Identifies gaps: features they have but we don't
  - Identifies advantages: features we have but they don't
  - Returns strategic insights

4) Output template (markdown format):
  - Executive Summary: Key changes this week
  - Pricing Changes section with table (competitor, old price, new price, % change)
  - New Features section (competitor, feature description, launch date)
  - Messaging Updates (competitor, page, old vs new headline)
  - Feature Comparison Matrix (table format)
  - Strategic Insights: 5 action items based on competitive gaps

- Alert flags:
  * 🚨 Red alert if competitor drops price by >15%
  * ⚠️ Warning if competitor launches major feature
  * 💡 Opportunity if competitor removes a feature

Behavior:
- When given a list of competitor URLs, scrape each one
- Compare with historical data if available
- If first run, create baseline (no changes to report)
- Store snapshots for future comparisons
- Run weekly comparison reports automatically
- Highlight high-priority changes at the top

Rules:
- Only report factual changes, no speculation
- If scraping fails, state "Unable to access [URL]"
- Price changes must show currency and percentage
- Feature additions must be specific, not vague
- Strategic insights must be actionable with clear rationale
```

### Kullanım Prompt'u:
```
Use the "Competitor Monitor" skill.

Track these competitors:
1. competitor1.com/pricing
2. competitor2.com/features
3. competitor3.com

Return:
- Summary of changes in last 7 days
- Pricing comparison table
- New features they launched
- Feature gap analysis (what they have that we don't)
- 5 strategic action items prioritized by urgency
```

---

## 🎨 Bonus Skill #2: Content Repurposer (İçerik Dönüştürücü)

**Ne işe yarar:** Uzun formatlı içeriği (blog yazısı, YouTube transcript, podcast notları) kısa sosyal medya postlarına, Twitter thread'lerine, LinkedIn postlarına, email'lere çevirir.

### Oluşturma Prompt'u:
```

```
Use the Skill Creator skill.

Create a skill named "Content Repurposer".

Goal: Transform long-form content (blog posts, transcripts, articles) into
multiple short-form assets optimized for different platforms.

Components:

1) references/platform_specs.md — platform guidelines:
   - Twitter: 280 chars max, 3-5 hashtags, thread format (1/n)
   - LinkedIn: 1300-2000 chars optimal, professional tone, 3 hashtags max
   - Instagram: 2200 chars max, 10-30 hashtags, emoji-friendly, visual hook
   - Email: Subject line (6-10 words), preview text (40-50 chars), 150-250 word
body
   - TikTok/Reel script: 15-30 second script, hook in first 3 seconds

2) references/content_templates/ — 3 sample outputs per platform showing
structure

3) scripts/extract_key_points.py — Python script that:
   - Takes long-form text input
   - Extracts 5-10 key points using NLP
   - Identifies the main hook/value proposition
   - Finds quotable moments (for Twitter)
   - Detects statistics/numbers (for credibility)
   - Returns structured JSON: hook, key_points, quotes, stats, cta

4) Output template (markdown format):
   For each platform, provide:

   **Twitter Thread (5-7 tweets)**
   - Tweet 1: Hook + promise
   - Tweets 2-6: Key points (one per tweet)
   - Tweet 7: CTA + link
   - Hashtag suggestions (3-5)

   **LinkedIn Post**
   - Attention-grabbing first line
   - 3 paragraphs: problem, insight, solution
   - Bulleted key takeaways (3-5 items)
   - CTA question to drive engagement
   - Hashtags (3)

   **Instagram Caption**
   - Hook with emoji
```

- Story-driven content (3-4 short paragraphs)
- Line breaks for readability
- CTA
- Hashtag block (15-20 relevant hashtags)

Email Version
- 3 subject line options (A/B test ready)
- Preview text
- Body (150-200 words)
- Clear CTA button text
- P.S. line (optional value add)

Short Video Script (TikTok/Reel)
- Hook (0-3 sec)
- Problem/Question (3-8 sec)
- Solution/Answer (8-20 sec)
- CTA (20-30 sec)
- On-screen text suggestions

Behavior:
- When given long-form content (blog, transcript, article), extract core message
- Generate platform-optimized versions simultaneously
- Preserve key facts, numbers, and quotes
- Adapt tone per platform (casual for Twitter/Instagram, professional for LinkedIn)
- Each version must be self-contained (no "read the full article" without context)
- Include engagement hooks: questions, controversial takes, actionable tips

Rules:
- Never lose critical information in repurposing
- Hashtags must be relevant, not generic (#success, #motivation banned)
- Each platform version must add unique value, not just be truncated
- If source content is <500 words, note "Content too short for full repurposing"
- Stats/numbers must remain accurate across all versions
- Always include 1 clear CTA per platform
```

### Kullanım Prompt'u:
```
Use the "Content Repurposer" skill.

Input: [paste blog post / transcript / article here]

Deliver:
- Twitter thread (5-7 tweets) with hashtags

- LinkedIn post with engagement question
- Instagram caption with 15-20 hashtags
- Email version with 3 subject line options
- TikTok/Reel script (30 seconds)

Optimize each for maximum engagement on that specific platform.

🎁 Bonus Kullanım Senaryoları:

Competitor Monitor:

- Her Pazartesi rakipleri tara
- Fiyat değişikliği olursa ekibe bildir
- Yeni özellik lansmanlarını yakala
- Aylık stratejik rapor hazırla

Content Repurposer:

- 1 blog yazısı → 5 platform içeriği
- Podcast bölümü → sosyal medya serisi
- Webinar kaydı → 20+ post
- Zaman tasarrufu: %80 ↓

Use the Skill Creator skill.

Create a skill named "AB Test Generator".

Goal: Generate A/B test ideas for any given URL with structured hypotheses, ICE scoring, and implementation steps.

Components:

1) references/methodology.md — A/B testing framework:
  - ICE Score formula: (Impact × Confidence × Ease) / 3
  - Impact scale: 1-10 (expected conversion lift)
  - Confidence scale: 1-10 (based on data/research)
  - Ease scale: 1-10 (implementation simplicity)
  - Test categories: Headlines, CTAs, Layout, Copy, Forms, Social Proof

2) scripts/scrape_page.py (optional) — Python script to:
  - Fetch URL content
  - Extract headlines, CTAs, forms, images
  - Return structured page elements

3) Output template (markdown):
  - Test ID and Goal
  - Hypothesis (If we [change], then [outcome] because [reasoning])
  - Control vs Variant description

- Implementation steps (numbered list)
- KPI to measure
- Expected impact (%)
- ICE score breakdown
- Quick win indicator (Yes/No)

Behavior:
- When given a URL, analyze the page (scrape or ask for summary if scraping fails)
- Generate 5 test ideas across different categories
- Prioritize by ICE score
- Flag 2 "quick wins" (Ease ≥ 8, Impact ≥ 6)
- Include at least 3 headline variants for top-scoring tests
- If no URL provided, work with generic e-commerce/SaaS assumptions

Rules:
- Each test must have actionable, specific steps
- Variants must be clearly different from control
- No vague suggestions like "improve design"
```

## Use the Skill Creator skill.

Create a skill named "Marketing Insights".

Goal: Ingest an uploaded CSV and produce accurate marketing KPIs and insights.

Components:

1) references/metrics.md — metric definitions and formulas:
- CTR = clicks / impressions × 100
- CPC = cost / clicks
- CPA = cost / conversions
- ROAS = revenue / cost
- ConvRate = conversions / sessions × 100
- Grouping keys: date, channel, campaign

2) scripts/analyze.py — Python script that:
- Reads the CSV safely using pandas
- Handles missing values (fill with 0 or skip rows)
- Computes KPIs grouped by: date, channel, campaign
- Detects anomalies: compare each day to 7-day rolling average
- Flag spike if value > 130% of 7-day average
- Flag drop if value < 70% of 7-day average
- Returns structured JSON with: overview, by_channel, by_campaign, anomalies, recommended_actions
```

3) Output template (markdown format):
  - Executive Summary section with overall KPIs (total spend, revenue, ROAS, CPA, conversion rate)
  - Alert section at the top:
    * Red alert if ROAS < 1.2: "⚠️ Red alert: inefficient spend"
    * Attention if CPA increases >30% vs 7-day average: "⚡ Attention: CPA spike detected"
  - Table 1: Top 3 and bottom 3 channels by ROAS
  - Table 2: Top 3 campaigns by conversion rate
  - Anomalies section: List significant spikes or drops with date and metric
  - Top 5 Actions checklist with rationale and priority (High/Medium/Low)

Behavior:
- When a CSV is uploaded, automatically run scripts/analyze.py
- Prefer determinism over inference
- If data column is missing, state "Column [name] not found - cannot calculate [metric]"
- Do not hallucinate numbers or make assumptions
- If no anomalies detected, state "No significant anomalies in this period"

CSV expected columns (flexible):
- date, channel, campaign (required)
- impressions, clicks, cost, conversions, revenue, sessions (at least 3 of these)

Rules:
- All monetary values should show currency symbol (default $)
- Percentages should show 2 decimal places
- Tables must be sorted by relevance (ROAS desc, CPA asc, etc.)
- Action items must be specific and measurable
```

## Kullanım Adımları:

1. **Claude'u aç** → Capabilities menüsü
2. **"Skill Creator"** skill'ini etkinleştir
3. Yukarıdaki prompt'u **olduğu gibi kopyala-yapıştır**
4. Claude skill'i oluşturacak

Skill hazır olunca şu şekilde test edebilirsin:
```
Run the "Marketing Insights" skill on my uploaded CSV file: traffic_analytics.csv

Return:
- Overview (total spend, revenue, ROAS, CPA, conversion rate)
- Top 3 and bottom 3 channels by ROAS
- Notable anomalies (spikes/drops vs 7-day average)

- 5 prioritized action items with rationale

UTM link geneartor:

Artifact Builder skill'i kullan.
Pazarlama ekibim için bir “UTM Link Generator” artifact’i oluştur:
- Giriş alanları: base_url, source, medium, campaign, term (opsiyonel), content (opsiyonel)
- “URL oluştur” butonu ve kopyalama tuşu olsun
- Basit doğrulama: base_url zorunlu; source/medium/campaign zorunlu
- Tek sayfa, sade tasarım

Ab geneator: UHey Claude—I just added the “ab-test-generator” skill. Can you make something amazing with it? “ab-test-generator” skill’ini kullan.
Şu URL için xxxxxx A/B test fikri üret:
- Her fikir için: Hedef (örn. kayıt oranı), Hipotez, Kontrol, Variant, Uygulama Adımları, Ölçüm KPI, Beklenen Etki, ICE skoru
- Hızlı kazanım (quick win) 2 test öner
- Kopyalanabilir başlık varyantları ver (en az 3)
Erişebiliyorsan sayfayı tara; yoksa içerik özetini benden iste.

Nakering insight:
“Marketing Insights” skill’ini kullan.
Şu dosyayı analiz et: traffic_analytics.csv
İstediğim çıktı:
- Genel özet (harcama, gelir, ROAS, CPA, ConvRate)
- Kanal bazında tablo (en iyi 3 kanal ve geride kalan 3 kanal)
- Anomali notları (ani düşüş/zirve)
- Hızlı aksiyon listesi (5 madde)
